

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

Claim 1 (currently amended): A system operative to recognize objects in content comprising:

- 
- a blackboard comprising
 - a plurality of experts, and
 - data comprising original input data and data created by processing of any of said plurality of experts, and
 - a controller operative to control said experts;
 - a belief model, coupled to said controller, comprising a set of beliefs and probabilities associated with each belief of said set of beliefs, wherein said belief model comprises a set of rules deduced from a learning system, said learning system comprising truth data files for deducing said set of beliefs, probabilities and shadow objects, a learning system controller and a statistics space controlled by said learning system controller, wherein said set of rules describes how different classes recognized by said learning system are related to each other spatially and physically;
 - a belief network, coupled to said controller; and
 - a relations subsystem, coupled to said controller.

Claim 2 (original): The system according to claim 1, wherein said experts comprise expert object recognizers comprising at least one of:

- region identification experts;
- color region experts;
- a corner recognizer;

09/881,746

a closed curve recognizer;
a roof recognizer;
a text recognizer;
simulated experts;
microphone recognizer;
space suit recognizer;
satellite recognizer;
a geometric shape recognizer;
a building recognizer;
an egg recognizer;
a dice recognizer;
a person recognizer;
a face recognizer; and
a product recognizer.

Q16
Claim 3 (original): The system according to claim 1, wherein said data comprises at least one of:

relations data;
expert status data;
image subsection data; and
said belief model.

Claim 4 (original): The system according to claim 1, wherein said controller is at least one of:

operative to choose chosen experts from said plurality of experts which are to be executed;
operative to schedule execution of said chosen experts; and
operative to execute said chosen experts.

09/881,746

Claim 5 (original): The system according to claim 1, wherein said blackboard further comprises at least one of:

storage for receiving an input image; and
a reporter operative to output results of processing.

Claim 6 (cancelled).

Claim 7 (original): The system according to claim 1, wherein said belief model is operative to predict existence of a shadow object in an image even if there are no specific experts capable of recognizing said shadow object.

Ab Claim 8 (original): The system according to claim 1, wherein said belief network is operative to combine beliefs in output data output by said experts and probabilities drawn from said belief model into a single belief for a given object.

Claim 9 (original): The system according to claim 1, wherein said relations subsystem is operative to determine how returned objects returned by said experts are related to each other.

Claim 10 (original): The system according to claim 1, wherein said relations subsystem is operative to determine spatial relations.

Claim 11 (original): The system according to claim 10, wherein said spatial relations include types comprising at least one of:

a north type,
a south type,
an east type,
a west type,
a contains type,
a contained by type, and

09/881,746

an adjacent to type.

Claim 12 (original): The system according to claim 1, wherein said relations subsystem is operative to determine temporal relations.

Claim 13 (original): The system according to claim 12, wherein said temporal relations include types comprising at least one of:

a before type,
an after type, and
an exists with type.

Ab Claim 14 (original): The system according to claim 1, wherein the content comprises at least one of:

video;
an image;
digitized content; and
a frame.

Claim 15 (cancelled).

Claim 16 (cancelled).

Claim 17 (currently amended). The system according to claim 1~~51~~, wherein said learning system is operative to assist in integrating a new expert, said new expert being adapted to create, encapsulate and compile said new expert; to add a stub function to said blackboard; if output of said new expert is new, to add the output to said belief model; and ~~wherein said new expert has been created, encapsulated, compiled, a stub function has been added to said blackboard, if output is new has been added to the belief model, and to add a blackboard rule has been added to control when said new expert will~~ is to be executed.

09/881,746

Claim 18 (original): The system of claim 1, wherein said belief network is at least one of:
a Bayesian Network;
a mean probability; and
a Dempster-Shafer Network.

Claim 19 (original): The system according to claim 1, wherein said belief model comprises:
rules operative to be used to make a determination whether or not one of said experts should be executed by search of said belief model to determine whether an adaptable threshold of supporting evidence has been exceeded for an execution supportability rule that evaluates outputs of currently executing experts.

Claim 20 (original): The system according to claim 1, wherein said belief model is operative to model expected object associations, to weigh relative object positions, and to tie a probability or belief value to those associations.

Claim 21 (original): The system according to claim 1, wherein said belief network is operative to combine the belief model with hypotheses generated by said experts to form belief values for hypothesized objects.

Claim 22 (currently amended): A method of recognizing objects comprising:
identifying classes of objects specified by a user using a plurality of cooperative object recognition experts;
achieving higher accuracy from using in parallel said plurality of cooperative object recognition experts than is achievable using in serial said plurality of cooperative object recognition experts;
supporting scalability of performance including supporting multiple processors;

09/881,746

developing a belief model by deducing a set of rules from a learning system, said learning system comprising truth data files for deducing beliefs, probabilities and shadow objects, a learning system controller and a statistics space controlled by said learning system controller, said set of rules describing how different classes recognized by said learning system are related to each other spatially and physically, the developing of said belief model including

specifying specified associations among said objects,
learning learned associations among said objects,
representing said specified and learned associations, and
forming a belief network

wherein said belief network is at least one of a Bayesian Network
and a Dempster Shafer Network; and

deducing said shadow objects from said belief model.

Claim 23 (currently amended): A method for adding a new expert to a blackboard comprising:

creating an expert;
encapsulating said expert;
compiling said expert;
adding a stub function to a blackboard;
determining if output of said expert is new and if new, then

adding the output's class to said blackboard, and

updating a belief model by providing truth data file data to a
learning system, said learning system comprising truth data files for deducing beliefs, probabilities and shadow objects, a learning system controller and a statistics space controlled by said learning system controller; and

creating a rule to control when said new expert is to be executed when
supporting evidence is found to exceed an adaptable threshold; and

06

deducing a set of rules from said learning system, said set of rules
describing how different classes recognized by said learning system are related to each
other spatially and physically.
